# HOW DO WE MEASURE ADEQUACY OR SUCCESS IN RETIREMENT PLANNING?

- Effective Household retirement planning requires having well defined objectives and tools for meeting those objectives.
- Households need to have an idea of
  - The replacement rate (net of Social Security) needed to achieve their retirement lifestyle objectives.
  - The assets needed to fund income for retirement consumption.
  - How to reach their target retirement assets and replacement rates.
- Households have 4 tools for hitting their targets
  1. Retirement savings contributions
  2. Retirement plan asset allocation (rate of returns)
  3. Date of Retirement
  4. Retirement Choices

## 2 CENTRAL QUESTIONS

1. What sort of feedback can we provide so that individuals can estimate whether they are in the retirement savings ballpark?
  - Needs to be simple and transparent in order to gain acceptance and widespread usage.
2. What can be done to structure or constrain decision-making in order to promote retirement income adequacy?
  - Any such program would need to create an appropriate balance between individual choice and program constraints.

# MEASURING ADEQUACY OR SUCCESS OVER THE LIFE CYCLE

- *Funding Ratio*: measures the adequacy of current DB plan assets to future liabilities.

$$FR_t = \frac{Assets_t}{PV\ Future\ Liabilities_t} \geq 1$$

- *Asset-Salary Ratio*: measures the adequacy of DC plan assets to hit a threshold replacement rate at retirement.

$$ASR_t = \frac{A_t}{S_t} \geq ?$$

## COMPONENTS OF THE ASR

- Target Replacement Rate
- Current Salary
- Current Assets
- Assumptions re:
  - Future salary growth
  - Rates of Return
  - Discount Rate
  - Years in Retirement
  - Estate Planning Objectives

# “PAR” ASSET/SALARY RATIO BY TARGET REPLACEMENT RATE

6% Asset Returns, 25-Year Annuity @ 6%, 4% Nominal Salary Growth, 10% Contribution Rate

## THE ASR IN PRACTICE

- Sample:
  - About 68,400 participants at 71 institutions
  - 2007 Cross-sectional Data
- Detailed Data on
  - Contributions (size and type)
  - Asset Allocation
  - Age
  - Retirement system tenure
  - Gender
  - Location

# SAMPLE STATISTICS

| Variable            | Mean      | St. Dev.  |
|---------------------|-----------|-----------|
| Age                 | 48.6      | 10.8      |
| Tenure              | 12.8      | 9         |
| Total Assets        | \$321,989 | \$385,227 |
| Total Contributions | \$12,178  | \$10,111  |
| Contribution Rate   | 16.9%     | 14.1%     |
| Salary              | 73,158    | 49,992    |
| Asset-Salary Ratio  | 2.8       | 10.3      |

# AGE COHORT

## CONCLUDING THOUGHTS

- As of 2007, these TIAA-CREF participants were, on average, more than adequately funded for retirement
- Two Biggest Factors for achieving retirement adequacy:
  - Early and long participation in a retirement plan
  - High contribution rates
- A Portfolio tilted to equities increases the likelihood of success but not as much as an adequate contribution rate or long tenure.
- Catch-up contributions are very important to some older participants retirement adequacy goals.
- Plans that encourage early participation and provide strong incentives for increased employee contributions increase the likelihood of participant retirement savings adequacy.
